

Advanced, safe & effective method of cataract removal

Getting specialised cataract surgery is now just a hop, skip and jump away. Perfect Vision Eye Hospital, the first and ever growing brand of perfect wellness, comprises of a full-fledged eye hospital that provides top-notch eye care services by highly experienced medical professionals and service personnel who genuinely care about the patient's wellbeing. It has always been in the continuous efforts for improving value to the customers.

Dr. Ashu Agarwal (MBBS, MS, Fellow Cornea) says "We, the Perfect Vision Team, continue to benefit our patients from ongoing improvements in phacoemulsification technology. Cataract surgery is already such a fast and efficient operation. We are primarily interested in new technologies that can expand our margin of safety - particularly in eyes with dense nuclei (mature cataract) and weak zonules. IVS is competitive for micro incision cataract surgery and gives us the ability to better customise technologies to our patient's need."

Recently, the hospital has come up with a safe and effective method of cataract removal. It offers a revolutionary new phacoemulsification technology 'Infiniti Vision System' (IVS). This state-of-the-art machine works on unique OZil torsional technology. Torsional ultrasound is a revolutionary new phacoemulsification technology that produces a side to side motion of the phaco tip as opposed to the forward and backward motion of traditional longitudinal ultrasound. With an enhanced fluidic management and surgical control, the IVS delivers the strategic advantage in customised phaco procedures.
